The global leader in door opening solutions

Hydraulic hoses transport oil to the cylinders

Function
The hydraulic hoses are connected between the hydraulic unit and the platform and lip cylinders. They are designed to transport oil from the hydraulic unit to the cylinders under high pressure.

How do they wear?
During the life time of the hoses there will be wear and tear due to:
- Natural material fatigue
- Aging due to weather conditions
- Damages due to dynamic load changes and deformations

Can I also replace them earlier?
Yes. The life time of a hose assembly shall not exceed a period of 6 years. This is not the installation date, but the manufacturing date. Check the date stamp and look for cracks in the surface and leakages in the assembly, hoses, fittings or the hydraulic unit. Also check the oil level.

What is the risk of not replacing?
In a situation where a hydraulic hose is broken, there will be a disturbance in the function of the leveler, but perhaps more importantly a risk of pollution.

CHANGE BEFORE IT BREAKS

Replace after
- 6 years
