NIHVA
NIHVA TECHNOLOGIES PVT. LTD.

Description	Polycarbonate sheet	Fabric
Material Properties	Made from a type of thermoplastic polymer.	Made from fibers, which can be natural (like cotton, wool) or synthetic (like polyester, nylon).
	Known for its durability and impact resistance.	
	Often used in construction, glazing, and protective covers.	
Durability and Strength	Highly durable and impact-resistant.	Less Durability as compare to Polycarbonate sheet.
	Can withstand harsh weather conditions and is often used for safety glazing and protective applications.	Fabric can degrade with exposure to sunlight and harsh environmental conditions unless treated or coated.
Flexibility and Workability	Resistant to UV rays and can maintain clarity over time.	
	Rigid and can be difficult to cut without special equipment.	Highly flexible and easy to cut, sew.
	Can be bent and formed to some extent, but usually requires heat or special techniques.	
Insulation and Thermal Properties	Generally provides good thermal insulation	Less Insulation properties.
	Can be used in applications where thermal control is important.	
Transparency and Light Transmission	Can be transparent, allowing for high light transmission.	Typically opaque, but some fabrics can be semi-transparent or sheer.
	Often used as a substitute for glass in applications requiring clarity and light flow.	Light transmission depends on the weave and type of fabric.
Applications	Roofing, skylights, windows, protective barriers, greenhouses.	Clothing, upholstery, curtains, tents, and other textile applications.
	Used in areas requiring high impact resistance and transparency.	Used where flexibility, comfort, and aesthetic qualities are more important.
Maintenance	Easy to clean but may require special cleaners to avoid scratching or damaging the surface.	Maintenance depends on the type of fabric.
	Can be prone to scratching if not treated.	Regular cleaning is needed; some fabrics require special care or dry cleaning.
