Technical Details for Data Sheet
Machine Protection Door RapidProtect™ 2000

Machine Protection Door RapidProtect™ 2000

Dirve unit:
- The drive unit is designed as a gear motor.
- The drive unit can be mounted either on the right- or lefthand side.
- For positioning the door, a pulse counter is used.

Control system MCC^{VectorControl}
- Control box standard: 220 x 380 x 100 mm
- Control box with extensition box: 220 x 560 x 100 mm

Linking with the machine:
As standard, our control systems gives the following signals:
- 2 potential-free safety contacts, when the door is closed
- 1 output when the door is opened
- 1 output when the door is closed
- 1 output for faults
- Controlling the door is accomplished by potential-free contacts

Safety limit switches:
To indicate "door safely closed," a safety magnetic switches are installed in the side frames.

In connection with a safety monitoring module in the control box the safety switch reach PL e according to EN ISO 13849-1 and SIL 3 according to EN 62061.

Alternatively, the system can be delivered without a safety monitoring module where the safety category then depends on the machines safety system.

Short cycle times:
- Up to 5 cycles/min, or 1 cycle/12 s - in continuous operation. One cycle is the time needed for the door to carry out one complete opening and closing cycle - see picture below.

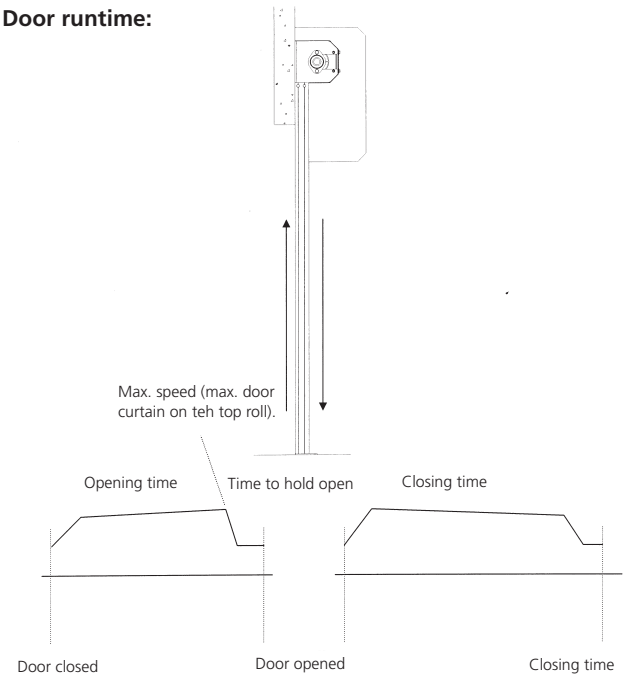

Door height	Max. speed*		Opening/Closing time*	
	Open	Close	Open	Close
1,5 m	2,0 m/s	1,2 m/s	1,5 s	2,0 s
2,0 m	2,0 m/s	1,2 m/s	1,9 s	2,4 s
2,5 m	2,0 m/s	1,2 m/s	2,1 s	3,0 s
3,0 m	2,0 m/s	1,2 m/s	2,4 s	3,3 s

* The values in the table are reference values. For individual doors this value can differ from the information.

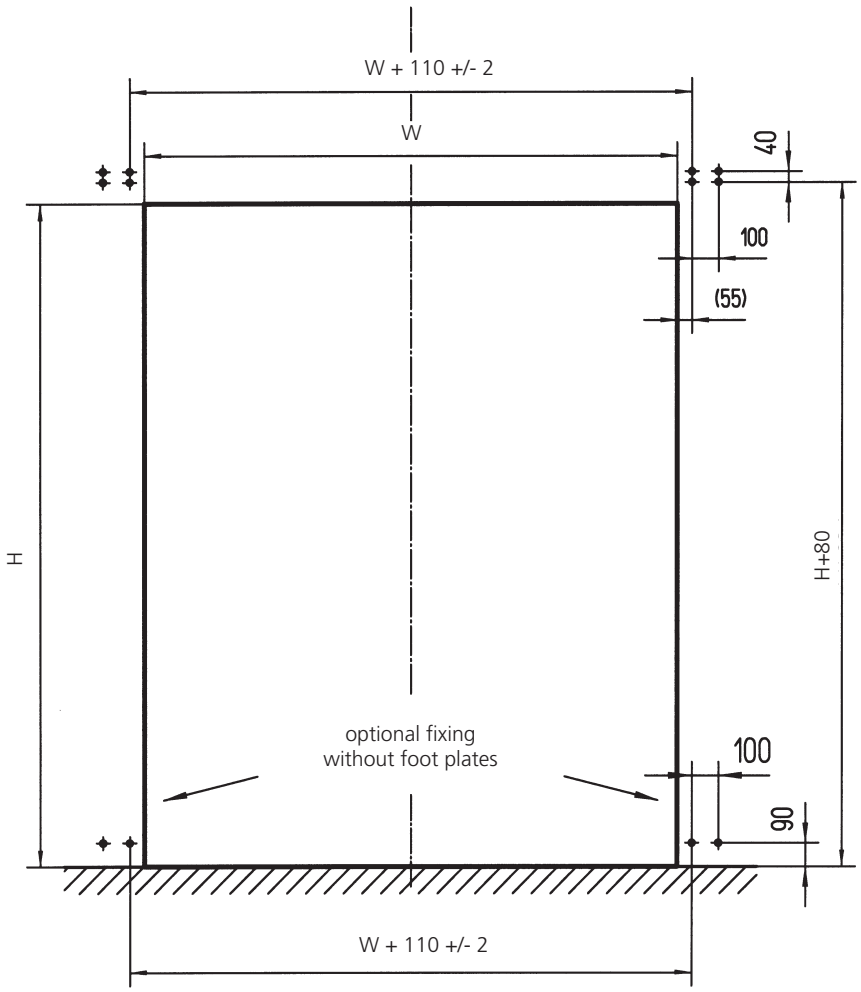

In particular additional processing times in the process flow may lead significant changes.

If the optional electrical safety edge is used, the closing speed will be reduced with approximately 15 %.

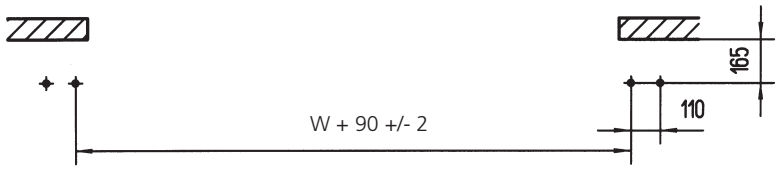

Door runtime:
