Preventive Maintenance

Air filter

ASSA ABLOY

ASSA ABLOY Entrance Systems

The global leader in door opening solutions

The air filter keeps the hydraulic oil clean

Function
The oil level in the tank of the hydraulic leveler fluctuates when using the dock leveler. This creates a pressure difference with the surrounding environment. Air from outside is added to compensate the pressure difference. The air filter prevents dust and dirt from entering the tank.

How do they wear?
The air filter becomes saturated by dust and dirt, which is its normal purpose.

Can I also replace them earlier?
It is hard to detect because the filter is in a sealed housing. Therefore we note the date of each change.

What is the risk of not replacing?
A saturated filter doesn't protect and can cause incorrect functionality of the hydraulic unit and accelerate the wear on the hydraulic components, e.g.;

- Reduce the life time of the oil from 3 to 2 years
- Erosion and accelerated wear of valves
- External and internal leakages in valves, pumps
- Obstruction of valves (silting)
- Corrosion

CHANGE BEFORE IT BREAKS

Replace after

- every year
