Preventive Maintenance
Hydraulic oil

ASSA ABLOY

ASSA ABLOY Entrance Systems

The global leader in door opening solutions

Hydraulic oil moves the leveler

Function
The dock leveler can be raised and lowered thanks to a hydraulic system that extends and retracts hydraulic cylinders. Hydraulic oil is pumped from the unit to the cylinders to change the position of the platform and lip.

How does the oil wear?
During operation, air is added to the hydraulic system to compensate pressure differences. This air contains water molecules that will end up in the hydraulic oil.

Can I also replace it earlier?
If you notice unusual movements in the leveler operation, this may be caused by obstruction of valves, pumps or cylinders, a direct result of oil contamination.

What is the risk of not replacing?
Water saturated oil causes corrosion of internal steel circuits. Corrosion particles in the oil may obstruct pumps and valves, leading to downtime. Other issues include:
- Erosion of valves
- Increased wear of moving parts, like valves, cylinders and pumps

CHANGE BEFORE IT BREAKS

Replace after
- 3 years
