Introduction:

The mechanism will be used to provide a bridging platform where person can move from one location to other using this bridging platform. The mechanism shall provide both horizontal and vertical movement. It will be used for persons to slide from one location to other at heights.

Functional requirements for the Mechanism:

Sl. No.	Specification
1	The mechanism shall be motor operated. The operating panel shall be also provided with the mechanism. (Model for manual operated mechanism shall also be given)
2	The mechanism shall be designed for 100-150 kg load.
3	The deflection due to load shall be minimum/negligible. (Exact deflection shall be specified)
4	The mechanism shall have extendable platform length of 1000mm. The total expendable length shall be 2400mm while shutoff length shall be 1400mm.
5	The width of the mechanism shall be 400-450mm.
6	The total weight of the mechanism shall be indicated and it shall be as minimum as possible.
7	Minimum height of the mechanism shall be 500-600mm and it shall be able to lift the personnel by 600-700mm.
8	Base of the mechanism shall be rigidly fixed and shall not shake during personnel movement.

Horizontal Movement:
Min. Horizontal length: 1400mm
Max. Horizontal length: 2400mm
Horizontal Stroke: 1000mm

Vertical Movement:
Min. Vertical length: 600mm
Max. Vertical length: 1300mm
Horizontal Stroke: 700mm

Orientation:
Angle from horizontal plane: 11 deg.
