A combination of entrance solutions at Netherlands' largest seafood supplier

Background
After being located in the center of town for nearly a century, Schmidt Seevis decided to move their storage facilities to the industrial park de Spaanse Polder. A large project that was tackled by architect Nico Alsemgeest. In collaboration with ASSA ABLOY Entrance Systems, Alsemgeest installed various automatic entrance solutions: a revolving door, overhead doors and loading as well as unloading systems.

Challenge
The greatest challenge that this project involved was the logistical order in performing the construction versus the tight schedule involved in moving the entire facility in just one day and in being directly operational.

The entrance
The initially chosen sliding doors were replaced with a revolving door as this better fits in with the customer's requirements for the entrance.
The requirement was that the entrance is wide enough to accommodate customers and employees entering and leaving the building with a seafood display of approx. 1.30 meters or a full trolley. This is why the revolving door is equipped with an automatic sliding door in the middle.

A further important requirement for the entrance was that the cool temperature of the shop had to be retained. Various types of fish are presented in counters filled with ice. The revolving door therefore serves as a barrier between the inside and the outside.

Requirements for the entrance
- Sufficient capacity
- An open and inviting appeal
- Sufficient door width
- Accessibility for disabled persons
- Barrier between indoor and outdoor climate

Solution
- Besam UniTurn 3600 mm revolving door, incl. automatic sliding door

Nico Alsemgeest of the architectural firm Alsemgeest Design & Build

The shop area is just a small part of the building. In addition to offices, the largest part of the building is comprised of storage and processing areas. Alsemgeest explains that the shipping area is located at the back of the building.

Challenge

According to Alsemgeest, the greatest challenge involved keeping climatic conditions under control in the shipping area. "The system had to bridge the temperature difference between the approx. 2 degrees inside the shipping area to 20 degrees or more on the outside."

The shipping area makes it possible for large and heavy goods vehicles as well as various kinds of delivery vehicles to easily enter and leave the premises. In terms of industrial doors and docking systems, it is very important that various different types of commercial vehicles have the possibility to load and unload their goods.

Curtain shelters were chosen for docks where similar types of vehicles arrive. In order to main the indoor temperature in shipping, inflatable dock shelters were chosen for the docks used for various different types of vehicles.

Requirements for loading and unloading systems

- Docking accommodations for various types of trucks
- Climate control in the shipping area

Solutions

- Overhead sectional doors, Crawford OH370, equipped with extra thick 70 mm panels instead of the standard 42 mm
- Dock levelers, Crawford DL6020T Teledock with mobile telescopic ensure temperature consistency
- Inflatable dock shelters, Crawford DS6070B, optimally seal off the area as they inflate all around the vehicle
- Curtain dock shelters, Crawford DS6060A, with aluminum frame

The result

According to Alsemgeest, the strict schedule of the product required the supplier to be flexible: "The collaboration with ASSA ABLOY Entrance Systems went very well. The project was completed during the holiday season of the construction industry, so very clear agreements had to be made with project management, the general contractor responsible for the building shell of the shop and the shopfitter of the shop. A great challenge. ASSA ABLOY Entrance Systems was perfect for the job."

The installation of the above solution makes it possible to keep the inside temperature consistent at 2 degrees in the shipping area. The revolving door installed in the 6-meter high storefront gives the building its inviting visual appeal, sufficient capacity and also ensures a consist indoor climate.
