A guide to preventative maintenance for Albany High Performance Doors

ASSA ABLOY

ASSA ABLOY Entrance Systems

The global leader in door opening solutions

Vibration damper

What is the function?

- To dampen the vibrations coming from door movement and take forces from the drive unit to the torque arm
- To improve the life length of theshafts
- To reduce forces in the system (drive unit /brackets / head plate / shafts)

What is the manufacturer's specification?

To make sure the manufacturer's specifications are observed, replace according to door type related specification sheet

Can I also replace it earlier?

- Yes, if there are visible rips and scratches on the dampers
- If there are small rubber chips in the motor cover or bottom plate
- When observing extended movement of the drive unit
- If there is heavy noise, indicating that the rubber is almost gone

How do they wear?

During the lifetime of the vibration damper there will be wear and tear due to:

- Rubber aging, rips and scratches due to aging
- Force intensity and direction of the force causing damage to the rubber and the damper

What is the risk of not replacing?

When not following the manufacturer's specifications the customer is taking the responsibility for unintended breakdown, e.g.:

- The positioning (open/close position) of the door is not exact which can lead to leakage in close position or overrunning the top position
- Increased forces on shafts and brackets, and the fixing to wall may get damaged
- Increased closing forces on the safety edge
- Increase of vibration of the whole door, which leads to damages of other parts on the door

Top reasons for preventive maintenance

- Keeps the warranty valid
- Prevents unexpected and expensive break-downs
- Prolongs lifetime
- Cost saving
- Minimises risk of personal injury
- Minimises energy loss
- Fulfills legal requirements
- Improves working environment
